## A Sine Wave Tracer

Name(s): _____

In this exploration, you'll construct an animation "engine" that traces out a special curve called a *sine wave*. Variations of sine curves are the graphs of functions called *periodic functions,* functions that repeat themselves. The motion of a pendulum and ocean tides are examples of periodic functions.

Sketch and Investigate

1. Construct a horizontal segment *AB*.
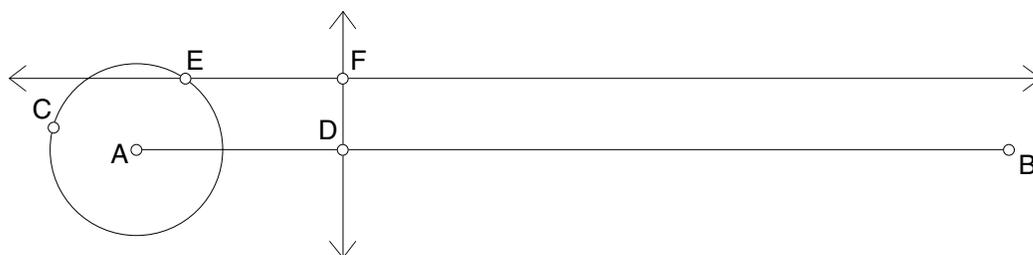

2. Construct a circle with center *A* and radius endpoint *C*.

3. Construct point *D* on $\overline{AB}$.

Select point *D* and $\overline{AB}$; then, in the Construct menu, choose **Perpendicular Line**.

4. Construct a line perpendicular to $\overline{AB}$ through point *D*.

5. Construct point *E* on the circle.

6. Construct a line parallel to $\overline{AB}$ through point *E*.

7. Construct point *F,* the point of intersection of the vertical line through point *D* and the horizontal line through point *E*.

Don't worry, this isn't a trick question!

Q1 Drag point *D* and describe what happens to point *F*.

Q2 Drag point *E* around the circle and describe what point *F* does.

Q3 In a minute, you'll create an animation in your sketch that combines these two motions. But first try to guess what the path of point *F* will be when point *D* moves to the right along the segment at the same time that point *E* is moving around the circle. Sketch the path you imagine below.

A Sine Wave Tracer (continued)

8. Make an action button that animates point *D* forward along $\overline{AB}$ and point *E* forward around the circle.

9. Move point *D* so that it's just to the right of the circle.

10. Select point *F*; then, in the Display menu, choose **Trace Point**.

11. Press the Animation button.

Q4 In the space below, sketch the path traced by point *F*. Does the actual path resemble your guess in Q3? How is it different?

12. Select the circle; then, in the Graph menu, choose **Define Unit Circle**. You should get a graph with the origin at point *A*. Point *B* should lie on the *x*-axis. The *y*-coordinate of point *F* above $\overline{AB}$ is the value of the sine of ∠*EAD*.
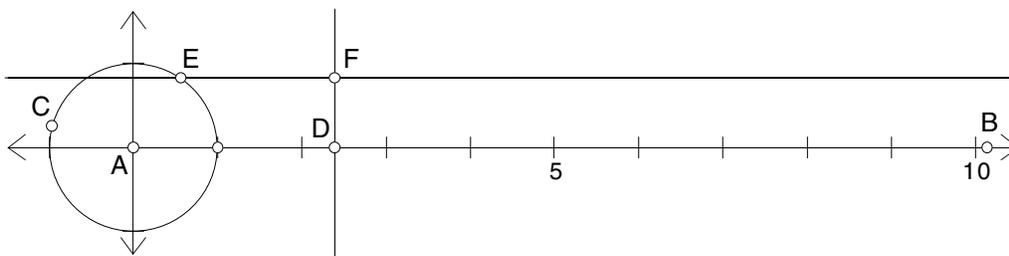

Q5 If the circle has a radius of 1 grid unit, what is its circumference in grid units? (Calculate this yourself; don't use Sketchpad to measure it because Sketchpad will measure in inches or centimeters, not grid units.)

13. Measure the coordinates of point *B*.

14. Adjust the segment and the circle until you can make the curve trace back on itself instead of drawing a new curve every time. (Keep point *B* on the *x*-axis.)

Q6 What's the relationship between the *x*-coordinate of point *B* and the circumference of the circle (in grid units)? Explain why you think this is so.
